

# Speech to Text for Google Applications

Last Modified on 08/07/2020 2:56 pm EDT

Along with Microsoft and Mac software you will also have access to speech to text applications via Google. With Google docs, slides, gmail, and more you will have access to speech to text features within Googles software.

Google speech to text is a powerful speech recognition technology developed by Google. It is also available for developers as Cloud Speech-to-Text API that they can use to build different apps and tools that are capable to convert audio to text using the powerful neural network on PC as well as mobile phones. On PC, the Google speech to text of Google can be used online in Google Docs, easily. You can either use a microphone to speak so that Google speech to text tool captures and transcribe that for you or just use some pre-recorded audio file. Both will work.

A thing which we need to keep in mind that, still, the accuracy of Google Speech Recognition technology is not 100%, you will get it around 70 to 80 percent. Also, it depends upon your accent, pronunciation of words and background noise.

You can learn more about this and how to use Google Speech works by [clicking here](#).
